Practitioner:	Richard Roberts, DVM	Completed Date:	11/07/2018 04:05:09 PM

Case Status/Priority: Completed / Regular

Case History:

Films being mailed in for the preliminary evaluation of the hips and elbows.

"Mia"

Microchip# 956000009996261

Case Report:

434238 KW/b5

A radiograph containing lateral projections of the elbows was submitted for evaluation. The radiograph is dated 10/16/18.

Radiographic Findings:

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Diagnosis: Normal elbows.

Comments: Radiographic changes to suggest elbow dysplasia are not present. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow dysplasia.

Consulting Radiologist:

Kent Wallace, DVM, MS, DACVR
